

Frontend Task
Birthday Card Application

We would like you to build a single page interface for a Birthday Card App based on the design provided.

The Birthday Card App is a service that sends emails to your friends to wish them a happy birthday.

The app will allow visitors to enter their name, email address and a date of birth. These simply need to be form elements on the page and do not need to be processed in any manner.

Please do not use a design framework (Twitter Bootstrap, Foundation, et al).

Points of Interest

The aim of this challenge is to demonstrate your understanding of frontend development. We would be interested to see examples of:

- HTML5 and CSS3 - where appropriate
- Responsive web design - demonstrate an understanding of designing for different screen sizes
- PHP - our framework at Deep Blue Sky has been built with PHP so our frontend developers must be able to demonstrate an understanding of PHP
- JavaScript - Any demonstration of expertise in this area is a bonus
- Ability to successfully convey the purpose of the app

Requirements

- Provide the static HTML, CSS, and JS for the app

Please do not spend more than an hour on the test. You do not need to finish.
